Practical: Study and Implementation of Software as a Service (SaaS) in Cloud Computing

Software as a Service (SaaS) is a cloud computing service model in which software applications are provided to users over the Internet.

The user does **not** need to install, maintain, or update the software on their own computer. The cloud service provider manages the application, servers, storage, updates, and underlying infrastructure.

Examples: Google Docs, Google Drive, GitHub, Canva.

Implementation of SAAS using Google Docs: Google Docs is a good SaaS example because anyone can access it directly through a browser without installing the application.

Step 1: Open a web browser.-->Sign in to a Google account.-->Open **Google Docs**.-->Create a new blank document→Enter some text in the document and save it.-->Click **Share**→Enter another user's email address.-->Viewer/Editor→Share the document.

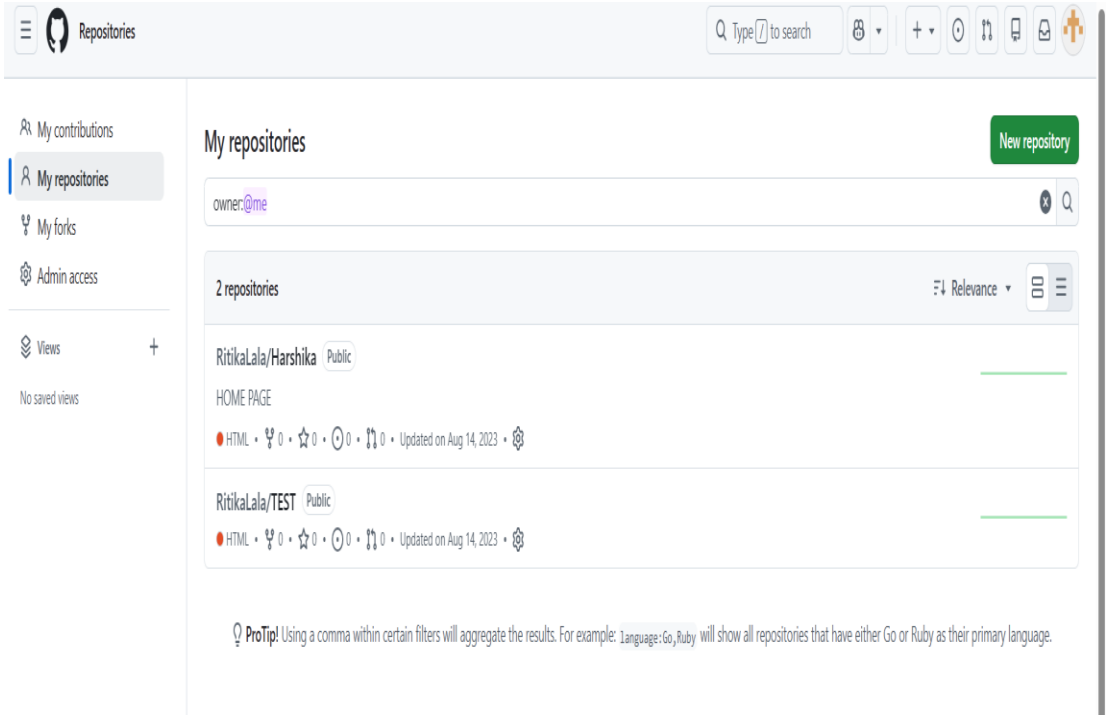

Step 2: Open the document from another device/account and verify collaborative access-→Make changes to the document and observe that the changes are synchronized through the cloud.

Result: Multiple users can access and collaborate on the same document/same software.

NEXT SIMILAR PRACT : To study and implement Software as a Service (SaaS) using GitHub for cloud-based code hosting and collaboration.

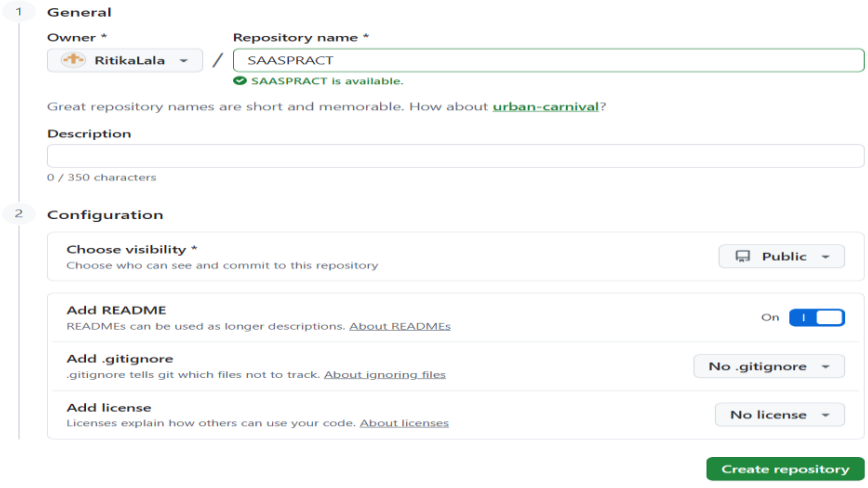

GitHub is SaaS because GitHub provides software development services through the Internet. Users can access repositories, manage source code, track changes, and collaborate with other developers without maintaining their own Git server.

Step 1. Create a GitHub account: https://github.com/ click on signup for new user

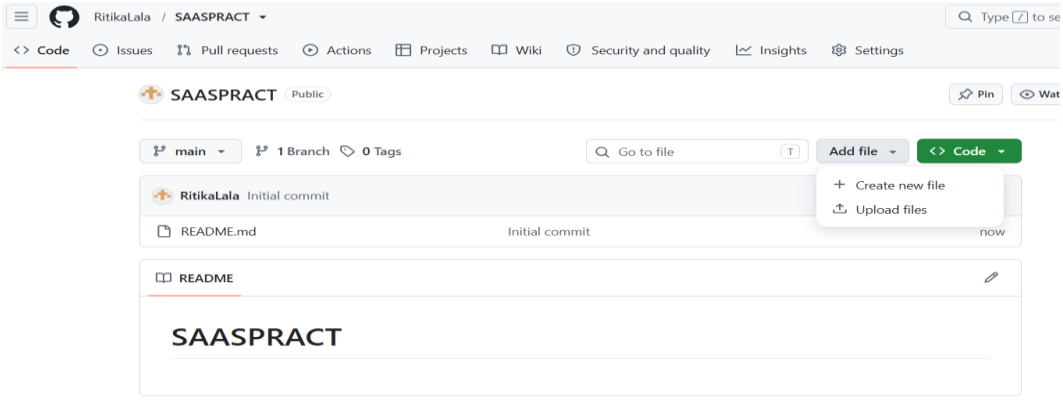

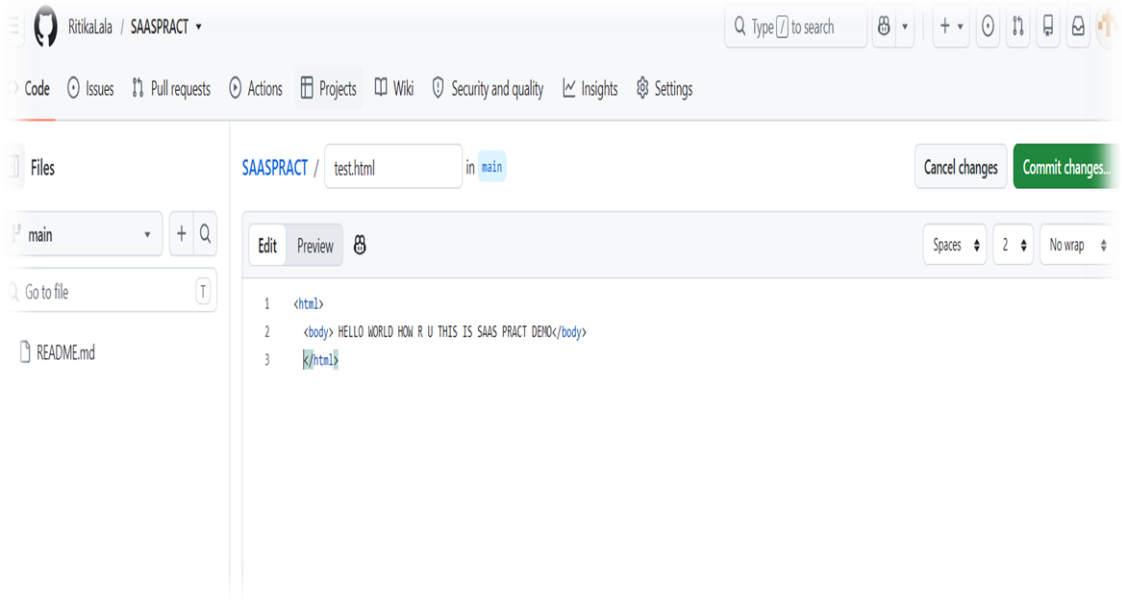

Step 2: **Create a Repository: Click + → New repository**

a) Enter repository name: SAASPractical
b) Select Public or Private. : Public
c) Select Add a README file.
d) Click Create repository

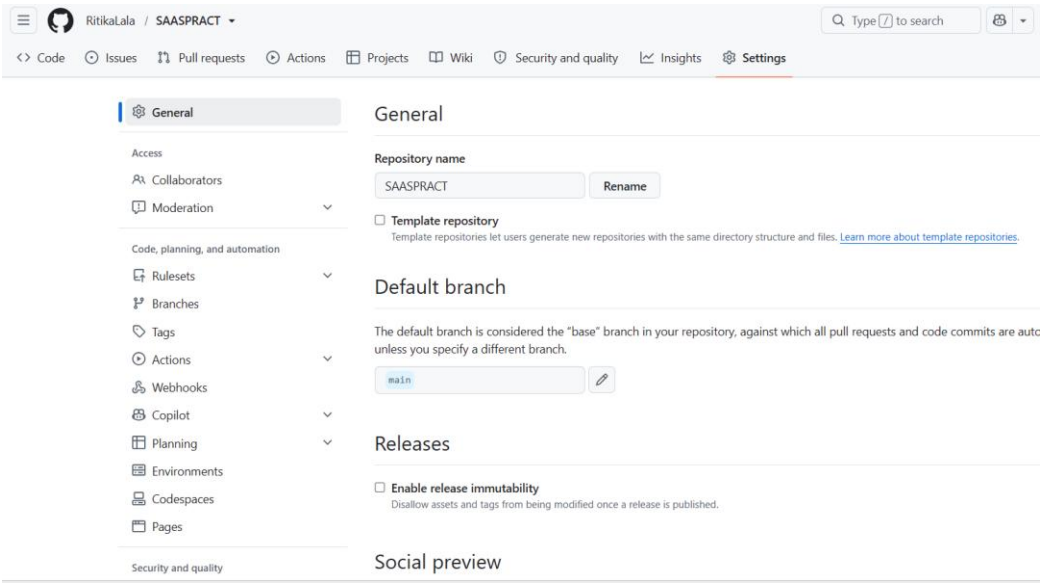

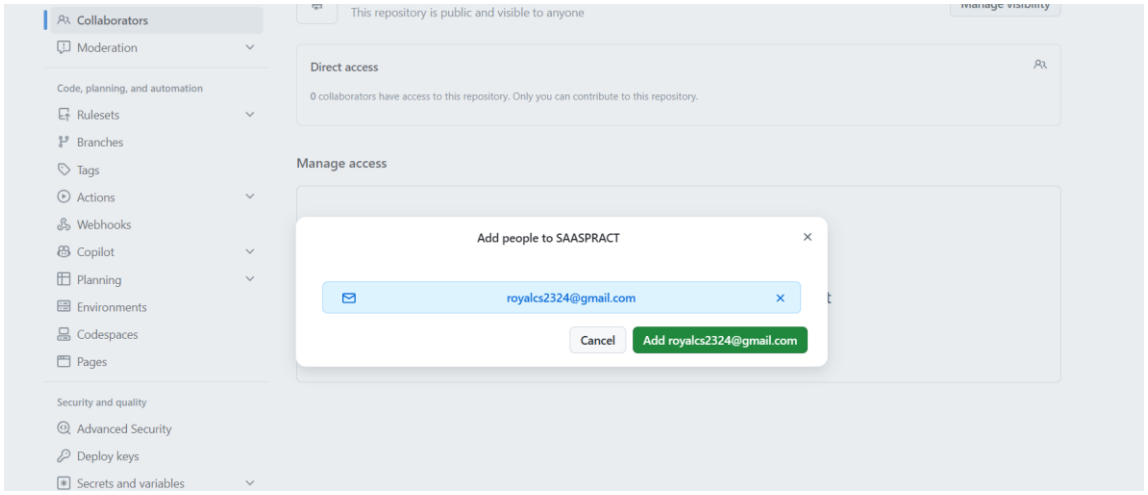

Step 3: Open the repository.--> Add file → Create new file test.html or College.py

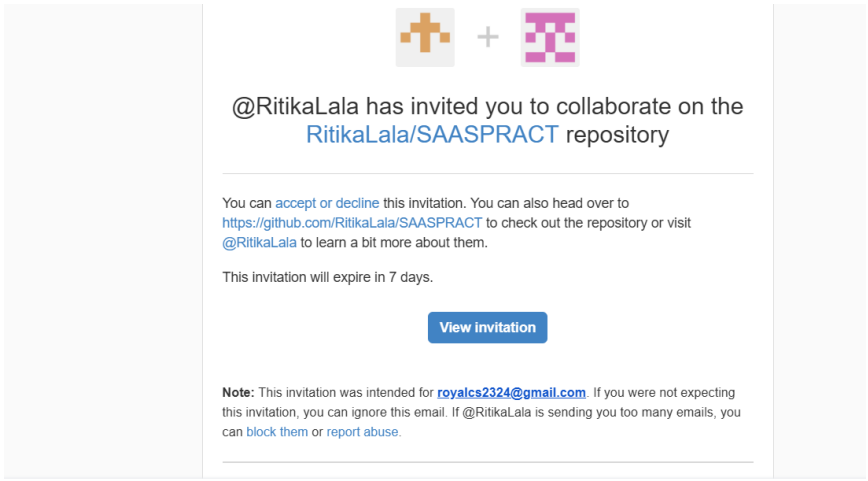

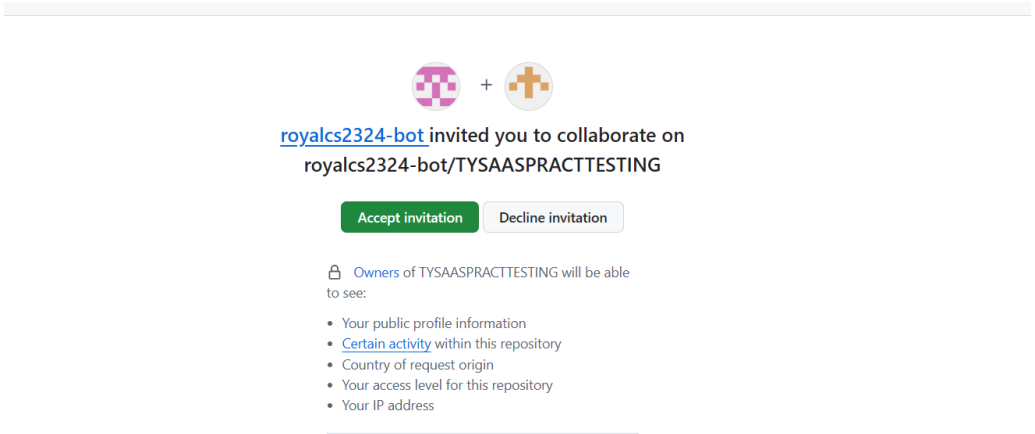

Step 4: Add collaborator for your repository : Click on repository settings

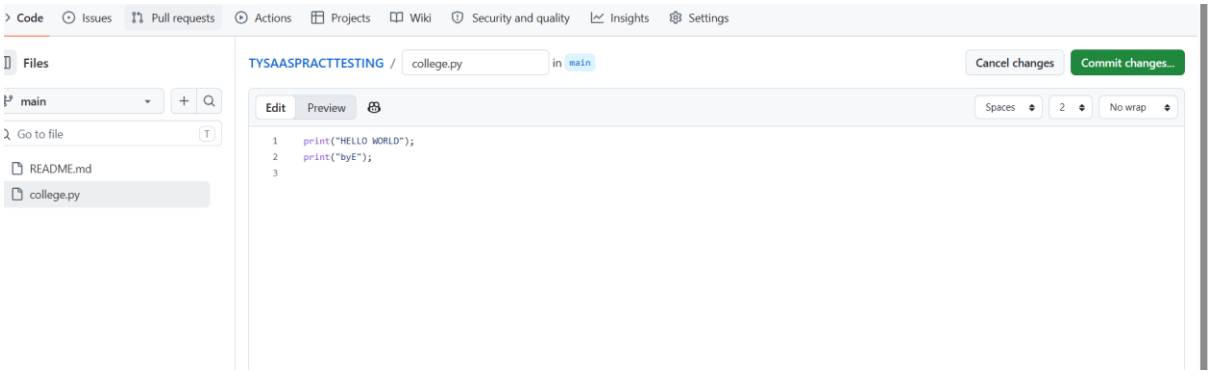

Step5: Accept invitation by login through another account in Github.--> click on notification icon → click on link for accept invitation.

Step6: once you accept invitation, you can do changes in the same file by using Edit option with main Branch selection.

Step7: SEE CHANGES IN FILE FROM BOTH USERS.
